

THE PROBLEM

A technical product experience that felt *difficult to navigate*

Airnergy Renewables offered innovative products, but the digital experience failed to communicate their value clearly. Users struggled to understand offerings, pricing, and the installation process.

- 01 Inconsistent UI components**
Outdated visual design with no cohesive component language made the site feel fragmented and untrustworthy.
- 02 Technical hierarchy issues**
Dense technical information presented with little visual hierarchy overwhelmed non-technical users.
- 03 Weak product storytelling**
Unclear CTAs and poor product narrative meant users couldn't easily identify which solution fit their needs.
- 04 Poor mobile responsiveness**
A large mobile user base was underserved by a desktop-first layout with broken responsive behavior.
- 05 Missing trust signals**
No testimonials, certifications, or case studies to reassure users making significant sustainability investments.

MY ROLE

Leading UX strategy and product design *end to end*

As Lead Product Designer, I defined the overall digital experience strategy and translated business goals into a scalable, user-centered interface.

- UX Research**
Stakeholder interviews and competitor analysis within the renewable energy space to identify usability gaps and positioning opportunities.
- Information Architecture**
Restructured website navigation and content hierarchy to make product discovery more intuitive for both residential and commercial users.
- UI Design System**
Created a modern visual system with reusable components, typography standards, spacing rules, and responsive layouts.
- Wireframing & Prototyping**
Designed low-to-high fidelity wireframes and interactive prototypes for stakeholder reviews and usability testing.

THE PROCESS

Turning complex sustainability products into a *simple digital journey*

A research-led, iterative process that moved from stakeholder discovery through to developer handoff — keeping user education and conversion design as dual north stars at every phase.

- 01 Discovery & Stakeholder Alignment**
Started by understanding Airnergy's business goals, target customers, and existing pain points. Discussions focused heavily on customer trust, education, and lead generation — identifying that users needed to feel informed before converting.
- 02 Competitive Analysis & UX Audit**
Reviewed renewable energy and sustainability websites to benchmark best practices in product communication, onboarding flows, and conversion design. Identified gaps in how competitors handled first-time renewable energy adopters.
- 03 User Flow Mapping**
Mapped user journeys for key audiences including homeowners, business owners, and first-time renewable energy adopters. This revealed clear friction points in product exploration and inquiry submission.
- 04 Wireframing & Content Structuring**
Created low-fidelity wireframes to establish layout direction and simplify technical information into digestible sections. Prioritized scannability and mobile responsiveness early in the process.
- 05 Visual Design & Prototyping**
Developed high-fidelity UI screens focused on clean layouts, eco-inspired branding, strong visual hierarchy, and conversion-focused CTAs.
- 06 Handoff & Implementation Support**
Prepared developer-ready design specifications and collaborated throughout implementation to maintain design integrity and responsive consistency across all breakpoints.

SCREEN DESIGNS

Key interfaces from the *redesigned platform*

- 01 HOMEPAGE REDESIGN**
- Dark-first hero with clear product navigation**
The homepage anchors on credibility — bold statistics, product access in one scroll, and a persistent CTA above the fold. The dark backdrop signals environmental seriousness while the lime green accent maintains energy and optimism.
 - ✓ Eco-inspired dark hero section
 - ✓ Stats as trust signals above the fold
 - ✓ Product quick-access strip
 - ✓ Consistent nav with clear CTA

PRODUCT DETAIL PAGE

- Technical specs made scannable and accessible**
Product pages split visual identity from technical detail — the left panel leads with the product character, the right panel surfaces specs in a digestible table format. Trust signals appear immediately below.
 - ✓ Split layout: visual left, specs right
 - ✓ Certification trust bar
 - ✓ Inline quote request CTA
 - ✓ Scannable spec table

- 02 LOGIN / DASHBOARD ENTRY**
- Brand-consistent sign-in experience**
The login page uses a split-panel layout — the left panel extends the brand language with live energy stats to reinforce value, while the right side keeps the authentication flow minimal and frictionless.
 - ✓ Split layout: brand left, form right
 - ✓ Live energy stats reinforce product value
 - ✓ Google SSO for frictionless entry
 - ✓ Clean, minimal form design

KEY CHALLENGES

Simplifying technical information without *losing credibility*

- 01 Technical complexity vs. accessibility**
Renewable energy concepts can easily overwhelm first-time users. The challenge was presenting technical product specifications in a way that felt approachable while still maintaining credibility for more informed customers.
- 02 Building trust through design**
Users making sustainability investments often require reassurance before submitting inquiries. The design needed to establish credibility through visual consistency, certifications, testimonials, and clearer process explanations.
- 03 Responsive experience across devices**
A large percentage of users accessed the site through mobile devices. Ensuring readability, fast navigation, and CTA visibility on smaller screens became a critical part of the design process.

THE OUTCOME

A cleaner, more trustworthy experience that *improved engagement*

- +28% Inquiry conversions**
Clearer CTAs and simplified user journeys drove more product inquiries.
- +35% User engagement**
Longer session durations and reduced bounce rates across all pages.
- Scalable design system**
Fully responsive component library ready for future product additions.
- Modern brand presence**
Credibility and mission alignment strengthened across all touchpoints.

LESSONS LEARNED

What shapes my approach to *the next project*

- Simplicity builds trust.**
For technical industries like renewable energy, simplifying language and visual presentation helps users feel more confident without reducing credibility.
- Education is part of the UX.**
Users were not just browsing products — they were learning about renewable energy. Designing educational touchpoints became just as important as conversion optimization.
- Consistency strengthens brand perception.**
A scalable design system improved not only usability but also the perceived professionalism and reliability of the company.
