

CASE STUDY 01

Redesigning BPI's Mobile Banking App

Onboarding & Cross-Selling

As Product Integration Officer at Bank of the Philippine Islands, I led the UX strategy and design execution for the app's two highest-impact touchpoints — resulting in measurable growth across traffic and performance.

+50%

Increase in web traffic after redesign

+20%

Performance uplift on key user flows

COMPANY

Bank of the Philippine Islands

ROLE

Product Integration Officer

TIMELINE

2022 – 2025

PLATFORM

Mobile Banking App

THE PROBLEM

An outdated design *holding back* growth

BPI's mobile banking app had accumulated years of design debt. The existing UI was outdated, lacked consistency, and couldn't scale to support incoming product features.

Onboarding friction

Users could activate accounts meant fewer customers completing the journey to active banking.

Missed cross-selling

The cross-selling experience failed to surface relevant products to the right users at the right time — leaving significant revenue potential untapped.

Accumulated design debt

Years of incremental additions had left the interface inconsistent and unable to scale with incoming product roadmap requirements.

MY ROLE

Bridging business goals *and user experience*

As Product Integration Officer, my responsibilities sat at the intersection of business analysis, product strategy, and UX design.

Feature Assessment

Reviewed and prioritized incoming feature requests against user impact and business value.

UX Research

Conducted user interviews and data reviews to validate design decisions at every stage.

Wireframing

Designed low-to-high fidelity wireframes to communicate solutions clearly to stakeholders.

Placement Strategy

Recommended optimal placement of new features within the existing app architecture.

THE PROCESS

From business case to *live product*

A structured, research-led process that turned ambiguous requirements into a measurably better experience — without losing sight of the regulatory constraints that govern every decision in banking design.

01

BUSINESS CASE REVIEW

Evaluated incoming feature requests by reviewing business rationale, strategic alignment, and feasibility. Assessed potential revenue impact and estimated users affected to build a clear prioritization case.

02

PRE-DISCOVERY & DATA REVIEW

Analyzed app usage data, funnel drop-off points, and existing feedback to identify where users were struggling. This phase helped narrow focus to the onboarding and cross-selling flows as the highest-priority areas.

03

USER INTERVIEWS & DISCOVERY

Conducted structured user interviews to understand pain points, mental models, and expectations around account opening and product discovery. Synthesized findings into clear design opportunities.

04

WIREFRAMING & DESIGN ITERATION

Translated research insights into low-fidelity wireframes, progressively refining to high-fidelity prototypes. Presented design options to stakeholders and iterated based on feedback.

05

IMPLEMENTATION & HANDOFF

Worked closely with the development team through implementation, providing design specs and responding to technical queries to ensure the final product matched the intended experience.

SCREEN DESIGNS

Redesigned screens from the *final prototype*

KEY CHALLENGES

Balancing security and usability in a *regulated environment*

01

Security vs. simplicity

Banking regulations required multiple authentication steps and data verification points during onboarding. The challenge was integrating these necessary friction points without making the experience feel punishing — particularly for first-time digital banking users.

02

Feature prioritization under constraints

With a large backlog of incoming features and limited development capacity, strategic decisions had to be made on what to build, when, and in what order. A prioritization matrix balancing business value, user impact, and technical feasibility guided these calls.

THE OUTCOME

Measurable impact on growth *and user experience*

+50%

Web traffic

Smoother onboarding reduced drop-off and increased account activation rates.

+20%

Performance uplift

Targeted UX improvements reduced task completion time across key flows.

New

Cross-sell feature

Contextually surfaced relevant products without disrupting core banking tasks.

×

Repeatable framework

Feature assessment and integration framework adopted across the team for future releases.

LESSONS LEARNED

What I'd carry into the *next project*

✓

Security and UX are not opposites.

The best designs found creative ways to meet security requirements while still reducing cognitive load — the two goals pushed each other toward better solutions.

✓

Data before design.

Reviewing usage data before conducting user interviews helped frame the right questions and avoid designing based on assumptions alone.

✓

Prioritization is a design skill.

Knowing what not to build — and being able to defend that decision with data — was just as important as the design work itself.
